

GOING OUT OF BUSINESS

MORE ETHANOL WILL CREATE NEW JOBS.

Hundreds of thousands of Americans are employed thanks to the 10% ethanol in most of our nation's gasoline.

This blend - called e10 - is the maximum allowed by a regulatory cap. By raising the amount of ethanol used, we'll be

creating thousands of green-collar jobs and putting billions of dollars into the economy - instead of sending that money overseas to buy foreign oil.

Not only will we be helping the economy, we'll be making our air cleaner, getting closer to energy independence, and improving our national energy security. Raising the cap will also provide the market needed to make cellulosic ethanol a large-scale reality. The technology is already here, and America is ready. Help us get the cap raised - and help America create the jobs, revenue and domestic energy it needs. Because this isn't just about fuel. It's about growth.

The ethanol we use now already replaces 661,000 barrels of petroleum every day. Higher blends could replace hundreds of thousands more.

The U.S. Department of Energy estimates that for every one billion gallons of ethanol produced, 10,000 to 20,000 jobs will be created domestically.

Cellulosic ethanol has the potential to meet the fuel needs of the world - but only if we allow the industry to grow by raising the regulatory cap on ethanol.

Ethanol isn't just a fuel. It's a solution. Join us at GrowthEnergy.org.

America. Enhanced by ethanol.
